# Pet problems solved: Interactive Q&A

#### DR JOANNE RIGHETTI

Animal Behaviourist

Pets can bring us great pleasure but certain behaviours of dogs, cats or their owners can be a source of great frustration for those who must deal with them. Problems such as excessive barking, aggression, fears, phobias and destructive behaviours are all common, yet annoying, behaviours. These can impact on our enjoyment of pets and our community's tolerance of pet owners.

This Interactive Q&A session will help you understand and deal with the unwanted behaviours of companion animals. The animal's drives and likely causes of the behaviours will be explained, together with suggestions of the most effective short-term management and long-term solutions to the problems.

Submit your questions and/or case studies prior to the session and Dr Jo will take you through the causes of and solutions to the cases described. No problem is too big, too small or too embarrassing to talk about so bring your most annoying cases, those you lose sleep over or those you are simply curious to understand.

## Paper: Whatever you need to know, just ask!

Pets can bring us great pleasure but certain behaviours of dogs, cats or their owners can be a source of great frustration for those who must deal with them. A modern dog's life may bring many challenges to both dog and owner (McGreevy & Boakes, 2009; Bradshaw, 2011) and cats are not without their share of unwanted behaviours too. Problems such as excessive barking, aggression, fears, phobias and destructive behaviours are all common, yet annoying, pet behaviours. These can impact on our enjoyment of companion animals and our community's tolerance of pet owners.

Solutions to pet behaviour problems require an understanding of behaviour and successful implementation of short and long-term solutions.

#### Instinct and learning

Behaviours in animals arise from a combination of instinct and learning. Instinctive behaviours are a result of drives, innate within species. Drives in our pets include the need to find food, the need for shelter and the need to have companionship. Often unwanted behaviours are a result of the animal trying to fulfil these needs.

Dogs, for instance, have an instinct or drive to hunt for food. This may lead them to chase birds, raid garbage bins or steal food from our tables. When they receive food from their actions, they are rewarded and learn that this strategy is productive. Drives, being inbuilt, cannot be removed without generations of breeding so we have to satisfy them, in appropriate ways.

Learning in animals involves a combination of processes, from simple *habituation* to repeated events (for example, your puppy no longer responding when the telephone rings), to *sensitisation* to anxiety-provoking events (for example, pacing during thunderstorms, leading to escaping and roaming the streets), to *trial and error* learning (for example, scratching at door, then barking to get owner's attention).

Our pets' behaviour is shaped by the owner's actions. Owners may provide opportunities for their pets to learn – attending puppy classes, for example, which encourages socialisation opportunities. Alternatively pet owners may be completely unaware of their impact on their pet's behaviour. Shouting at their dog for barking, for example, is often an attempt to reduce unwanted, noisy behaviour but may have the opposite effect of reinforcing it.

The manner in which people respond to unwanted pet behaviours will affect their outcome, as will how we teach our pets. Owner actions may vary from:

- positive, motivational encouragement of desired behaviour eq. praise or treats
- negative reinforcement, involving the removal of discomfort on performance of desired behaviour eg. head halters
- punishment, including either:
  - positive punishment eg. shouting or inflicting physical pain
  - negative punishment eg. withdrawal of treats or time out

Animals may be trained using a variety of methods but it helps to understand just how they learn [McGreevy, 2007].

## Solving common behaviour problems

Behaviour problems are best solved when their cause is understood. Causes may include natural drives or learned behaviours and also the environment the pet lives within.

One of the most common unwanted behaviours in dogs is barking (Righetti, 2012a). Barking may be an instinctive behaviour in dogs, to communicate to other individuals – dog or human – but it can be difficult to understand just why some need to bark so often or for such great lengths of time. Barking is also a leaned behaviour, dogs using this behaviour to have an impact on their environment.

Barking, in fact, is a symptom and we need to understand its cause. Once it is understood that a dog is bored or anxious or is responding to events in the environment or is seeking their owner's attention, then strategies can be put in place to reduce the unwanted barking.

Solutions to behaviour problems generally include:

- Short-term management strategies to ensure the safety of the animals that the undesirable behaviour impacts and to provide immediate reduction, if possible, of the unwanted behaviour.
- Long-term solutions which address the needs of the animal, provide appropriate outlets for their drives and teach the pet a more desirable behaviour.

Short-term management of barking may include the use of anti-barking devices or relocating the dog to a different area of the home to prevent barking at certain times of the day. Long-term solutions may include relieving the dog's anxiety, providing outlets for their energy or teaching them to be quiet.

Other common dog behaviour problems such as aggression (Righetti, 2012b) and anxiety (Righetti, 2012c), over being alone or meeting other dogs for instance, can also be addressed by following a short-term management strategy and long-term goal implementation. Cat behaviour problems such as anxiety (Righetti 2012d) or toileting issues (Righetti 2012e) can also be addressed this way.

#### About the author

With a passion for pets and extensive knowledge of human-animal relationships, animal behaviourist Dr Joanne Righetti consults with pet owners, councils, commercial companies and not-for-profit organisations. She is a also a regular radio guest, a speaker aboard P&O cruises and also hosts interactive sessions at numerous pet events. Joanne attracts significant following on digital and social media, including a website, blog, twitter and facebook. Her latest venture is a series of pet behaviour books tacking common issues such as barking, anxiety and aggression. More about Dr Jo and her business Pet Problems Solved at www.joannerighetti.com
